

The MIT Deliberatorium: Enabling Large-Scale Deliberation About Complex Problems

Mark Klein

MIT Center for Collective Intelligence

<http://cci.mit.edu/klein/>

The Center for Collective Intelligence

- ◆ Founded in 1995, re-named in 2006: <http://cci.mit.edu/>
 - ◆ Creating new examples of collective intelligence
 - ◆ The Deliberatorium
 - ◆ The Climate CoLab
 - ◆ Collective Prediction
 - ◆ Studying collective intelligence in today's organizations
 - ◆ Distributed Collaboration (surveys)
 - ◆ Sensible Organizations (badges)
 - ◆ Developing theories of collective intelligence
 - ◆ The Handbook of Collective Intelligence
 - ◆ Measuring Collective Intelligence

The Challenge: Wicked Problems

- ◆ Failure of existing institutions to address pressing “wicked” challenges, despite great technical prowess

“Upon this gifted age, in its dark hour,
Rains from the sky a meteoric shower
Of facts...they lie unquestioned, uncombined.
Wisdom enough to leech us of our ill
Is daily spun; but there exists no loom
To weave it into fabric...”

Edna St Vincent Millay, From Huntsman, What Quarry? (1939)

Emergence of Social Computing

QuickTime™ and a
decompressor
are needed to see this picture.

Can Social Computing Help?

- ◆ Vast potential resources

2B Internet users, 5B mobile device users, double digit growth
Cognitive surplus (US TV Ads: 1 wikipedia/weekend)

- ◆ Massive levels of **voluntary** contribution

Twitter - 50 million tweets per day (600 / second)

Flickr - 73 million visitors/month, 700 million photos

Wikipedia - 15 million articles, 270 languages

Blogs - 100 million blogs, 1.3 billion blog posts daily

Second life - 5 million unique residents

Youtube - 35 hours of video uploaded per minute

Can Social Computing Help?

◆ *Potential* for emergent super-intelligence

Each of them individually may not be of good quality, but they may surpass, collectively, the quality of the few best. *Aristotle, 300 BC*

- ◆ Idea synergy
- ◆ The long tail
- ◆ Many eyes
- ◆ Wisdom of the crowds
- ◆ Many hands
- ◆ Quality competition

Anyone taken as an individual is tolerably sensible and reasonable; as a member of the crowd, he at once becomes a blockhead. *Bernard Baruch, 1900 AD*

- ◆ Groupthink
- ◆ Extremization
- ◆ Arrows' Voting Paradoxes
- ◆ Strange Attractors
- ◆ ...

Key Question

Social computing enables unprecedented opportunities for large scale **knowledge sharing** (e.g. via email, newsgroups, chat, forums, blogs, wikis, podcasts, microblogs etc.)

Can it foster **large-scale deliberation** - i.e. the synergistic (additive or even super-additive) channeling of many minds towards solving complex and controversial problems?

What's Wrong with Current Tools?

Most tools (e.g. forums, blogs, email, IM)
organize interactions by *time*

scattered & haphazard
coverage

balkanization

small voices get
drowned out

poor argumentation is
common

**Incomplete and often flawed
content**

**Hard to make sure your voice
is heard**

**Hard to find the good stuff
amongst all the noise**

What About Wikis?

It's true: wikis are organized *topically*, one article per topic

But: wiki articles by their nature capture *consensus*. When applied to **controversial topics**, they:

- produce “least-common-denominator” content
- involve massive time-centric discussions and wasteful “edit wars”
- and thus are prone to the same limitations as other collaboration-support technologies

QuickTime™ and a
decompressor

Kittur, A., B. Suh, B. A. Pendleton and E. H. Chi (2007). He says, she says: conflict and coordination in Wikipedia. SIGCHI Conference on Human Factors in Computing Systems.

What About Idea Sharing Tools?

Idea sharing tools present **questions** each linked to collectively generated and rated **answers**

But: sheer volume undercuts added-value

- **Redundancy:** most ideas are repetitions or minor variants of each other: Google project10tothe100 generated 150,000 ideas, needed 3,000 volunteers & 9 additional months to sort through
- **Lock-in:** users tend to rate only the highest-rated ideas, ignoring potentially superior ideas buried below
- **Non-collaborativeness:** users tend to submit lots of simple ideas, instead of a few detailed ones, because there is no mechanism for collaborative refinement

Argument Mapping Can Help!

Argument mapping can address these limitations by the simple but powerful trick of organizing contributions by **topic**, rather than by **time**.

Contributions are broken down into **issues**, **ideas**, and **arguments**

 issue	a problem that needs to be solved
	
 	

Every point can only appear **once** and is attached to the point it **logically** refers to

What government policy can best meet our targets for reducing greenhouse gas emissions?

Use carbon tax

Use cap and trade

Prone to be gamed by industry

You're right - see EU experience

How will certificates be distributed?

Given away for free by the government

Sold to the highest bidder

An Example

Planeta.com
(5/1/08) had a
13-page
discussion on
carbon
offsetting pros
and cons

Original Planeta a
commentary and a
discussion on
carbon offsetting
are needed to see this picture.
are needed to see this picture.

[-] ? Is Carbon Emission Offsetting a good idea?

☐ 💡 yes ★★★★★

👍 carbon offsets do reduce greenhouse gas emissions (if not fraudulent) ★★★★★

👍 it is getting easier and easier to find good carbon offsets ★★★

👍 Many major meetings are using them ★★

☐ 💡 no ★★

👍 it fosters complacency, distracting from more important measures ★

👎 it's too easy to cheat; may not always decrease carbon emission! ★★★★★

meaningful rating

Benefits of Argument Mapping

- ❑ **No scattering**: all content on a given topic is co-located, so access is quick and balkanization is reduced
- ❑ **Better coverage**: easier to find gaps that need to be filled
- ❑ **No redundancy**: each unique point can only be made **once**
- ❑ **Bias towards well-founded arguments**: the system makes compelling arguments – or the lack thereof – **visible**

Better, more complete content

Small voices can be heard

Easier to find the good stuff

The Challenge of Scale

The MIT Deliberatorium

Integrates argumentation theory with large-scale social computing

- Open authoring to enable many eyes/hands effects
- Meta-contributors to manage process
- Watchlists/rollbacks for self-healing
- Rating to incent quality contributions
- Social translucence to focus attention

Authors

Unbundle – break your thoughts into points that each contain just one issue, idea, or argument.

Locate – search the argument map to see where your point(s) belong

Enter – If it's a new point, create a new post, else refine existing post.

The **live-and-let-live** rule:
only edit a post to **strengthen** it

Moderators

Certify well-structured posts - a *coaching* role

The **honest broker** rule:
remain strictly **content-neutral**

Readers

Rate to highlight worthy posts

Only **certified posts** can be viewed by readers

Collective Intelligence Doesn't Sleep

~3000 posts (~1900 certified) plus ~2000 comments

Most Posts Were Well-Mapped from the Start

About 2/3rds required no changes before certification

Users Improved Over Time

moderator inputs needed to get certified decreased 35%
with time ($p < 10^{-8}$)

Qualitative Observations

a large non-expert
community can
comprehensively cover a
complex contentious topic
in just a few days with *no*
top-down coordination

Need 1 moderator per 20
active authors

A cheap way to get usable
outside input

An Opportunity for AI/Agents

- ◆ large-scale argument maps allow *much* more powerful formal reasoning than conventional social media
 - ◆ a little formalization goes a long way
 - ◆ Balkanization
 - ◆ Irrational bias
 - ◆ Controversiality
 - ◆ Groupthink
 - ◆ a little information (per user) in abundance is a lot

Open Challenge: Attention Allocation

- ◆ Even moderate-size user communities rapidly generate **very large maps** when topics are complex
- ◆ This problem is hugely exacerbated if issues are *interdependent* (so idea *combinations* matter)
- ◆ How can we ensure people *see the forest for the trees*?
 - ◆ users know where they can contribute most
 - ◆ managers can find areas that need intervention
 - ◆ stakeholders can see which branches are ready to “harvest”

QuickTime™ and a
decompressor
are needed to see this picture.

Open Challenge: Quality Control

- ◆ How do we separate the wheat from the chaff?
 - ◆ Wide range of knowledge & expertise
 - ◆ Lots of uncertainty
 - ◆ Ubiquitous saboteurs
 - ◆ But also: lots of redundancy to exploit

Open Challenge: Structuration

- ◆ How can we help messy thinkers create well-structured maps?
 - ◆ Unbundling and typing is easy
 - ◆ Taxonomizing is a skilled **art**

Open Challenge: Integrating Computation

- ◆ How can we seamlessly (& **proactively**) integrate computational resources within human deliberations?
e.g. simulations and other analytics

A General Problem

- ◆ Semi-formal social computing systems (the “semantic web”) are probably the wave of the future
 - ◆ cf freebase (started by Danny Hillis, now Google’s)
